INTRODUCTION

In our project, we have tried our best to make the complicated process of hotel management as simple as possible using object-oriented methodology and a simple menu-oriented interface. We have tried to design the project in such a way that user may not have any difficulty in using this package and further expansion is possible without much effort. Even though we cannot claim that this work to be entirely exhaustive, the main purpose of this project is to perform each employee's activity in computerized way rather than manually which is time consuming.

We are confident that this software package can be readily used by non-programming personal avoiding human handled chance of error. This project is used by two types of users: -

i. Customers
ii. Administrator (management of the Hotel).

Administrator can maintain daily updates in the hotel records. Administrator must be an authorized user.

The main aim of the entire activity is to automate the process of day-to-day activities of hotel like room activities, admission of a new customer, assigning a room according to customer's demand, checkout of a customer and releasing the room and finally computing the bill etc.

The limited time and resources have restricted us to incorporate, in this project, only a few functionalities in our Hotel Management System, but utmost care has been taken to make the system efficient and user friendly.

"Hotel Management System" has been designed to computerize the following functions that are performed by the system:

- Add database of rooms in the hotel
- Guest Summary
- Search Room (search and view details of a particular room)
- Search Customer (search and view details and information of a particular customer)
- Admission of new customer
- Room assigning related to customer's need
- Generating bill for a customer
- Check-in customer
- Check-out customer
- Check availability of rooms

OBJECTIVE

➤ ☐A computer-based management system is designed to handle all the primary information required.

➤ Separate database is maintained to handle all the details required for the correct statement calculation and generation.

➤ This project intends to introduce more user easiness in the various activities such as record updating, maintenance, and searching.

➤ The searching of record has been made quite simple as all the details of the customer can be obtained by simply keying in the identification of that customer.

➤ Similarly, record maintenance and updating can also be accomplished by using the identification of the customer with all the details being automatically generated. These details are also being promptly automatically updated in the master file thus keeping the record absolutely up to date.

➤ The entire information has maintained in the database or Files and whoever wants to retrieve can't retrieve, only authorized user can retrieve the necessary information which can be easily accessible from the file.

REQUIREMENTS

✓ Menu-driven user interface to allow the users to navigate through the different functionalities.

✓ Login page to operate as an administrator / customer followed by login details (name, phone number, address, and password in case of administrator).

✓ Customer-specific input requirements:

- Room requirements of the customer (AC/non-AC, room size, comfort type).
- Search for specific room availability.
- Customer check-in and check-out.

✓ Admin-specific input requirements:

- Add rooms to the database along with room details (AC/non-AC, room size, comfort type).
- Check the occupancy history of the hotel.

CONCLUSION

The computerized Hotel Management System we have built was designed while keeping in mind the general problems that would have been faced by the customers/hoteliers. The design and implementation are solely done on the fundamental principles of Object-Oriented Methodology, where each entity or class corresponds to a real-life object.

For example, we have three major classes which User, Room and Hotel. The User class is further divided into two subclasses, Admin and Customer, which respectively contain details on administrators and customers as users of the software. The functionality and uses of all the other classes in our project revolve around the forementioned major three classes.
